

# City Models

US, Europe, Asia, and Africa

# Concentric Zone Model

# Concentric Zone Model (1920s ) - By Ernest Burgess

Based on the city of Chicago

Lower classes live closest to the CBD, upper classes live farther out.

1st ring- CBD acts as the commercial center of the city (peak land value)

2nd ring- zone in transition, contains slums; new immigrants to the city

3rd ring- working class home, older neighborhoods

4th ring- middle class homes

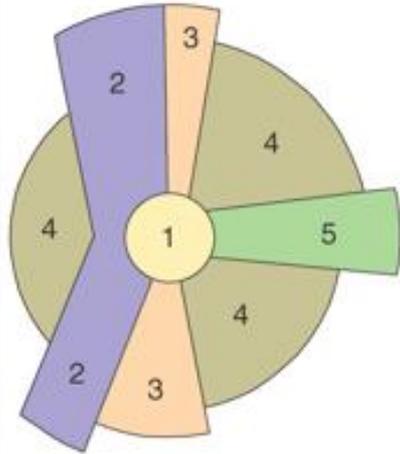

5 ring- upper class, commuter zone

## Invasion and succession

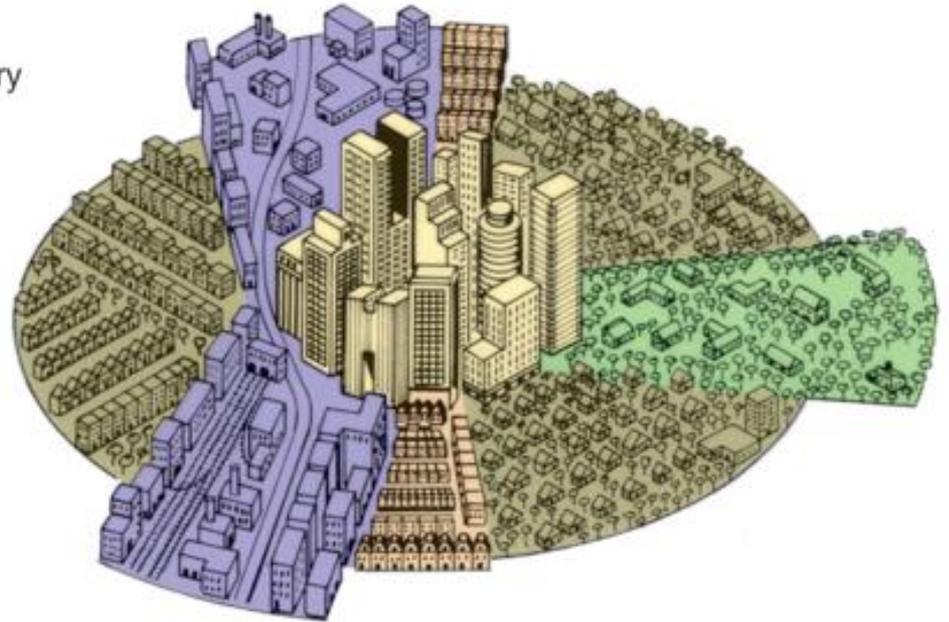

## Problems:

reflects perception but not reality and upper class residents usually follow transportation routes

# Sector Zone Model

1. Central business district
2. Transportation and industry
3. Low-class residential
4. Middle-class residential
5. High-class residential

# Sector Zone Model (Chicago)

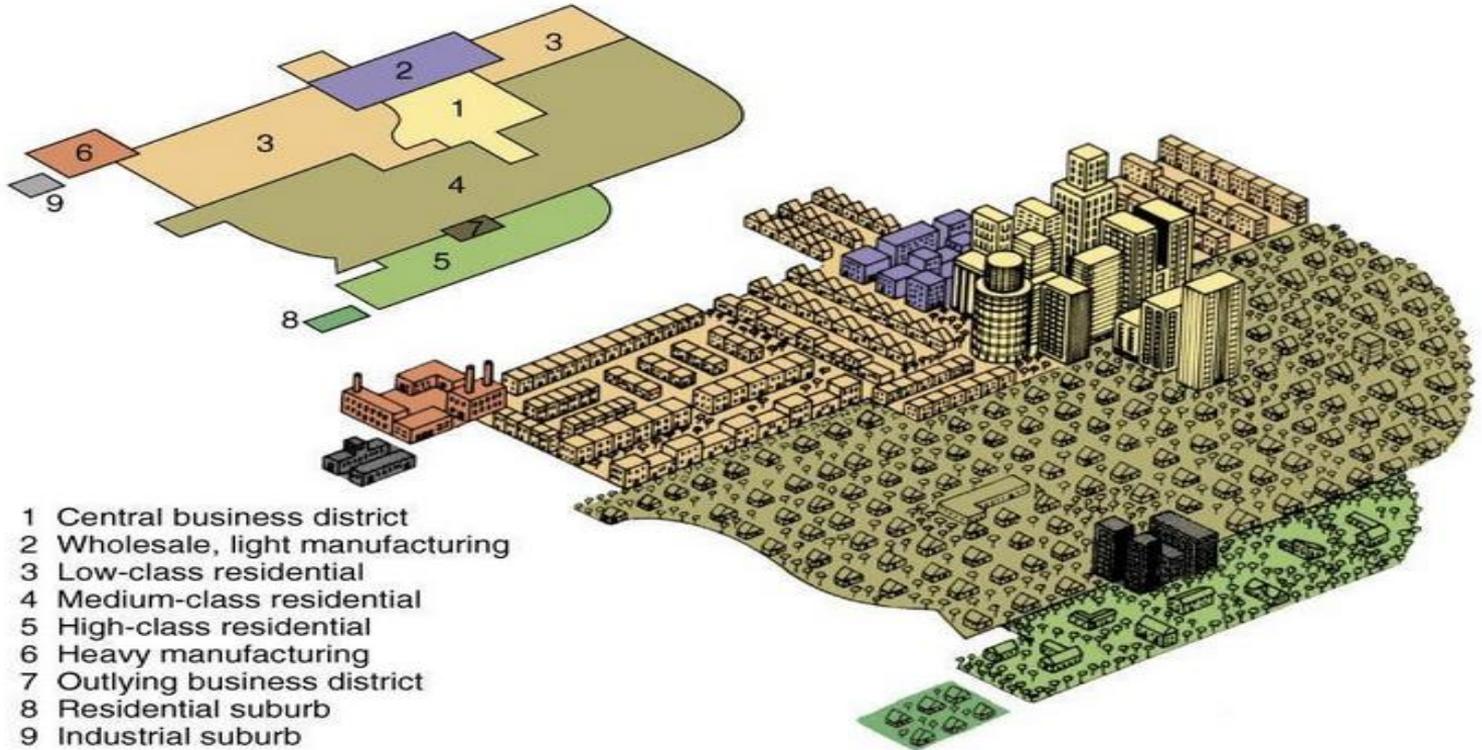

Homer Hoyt (1939)

Based on class and takes into account transportation systems

Social structure defines neighborhoods

Industrial zones extend along major transportation routes

# Multiple Nuclei Model

# Multiple Nuclei Model (1945)

Chauncey Harris and Edward Ullman

Urban growth is independent of the CBD and spring where there is opportunities

airports

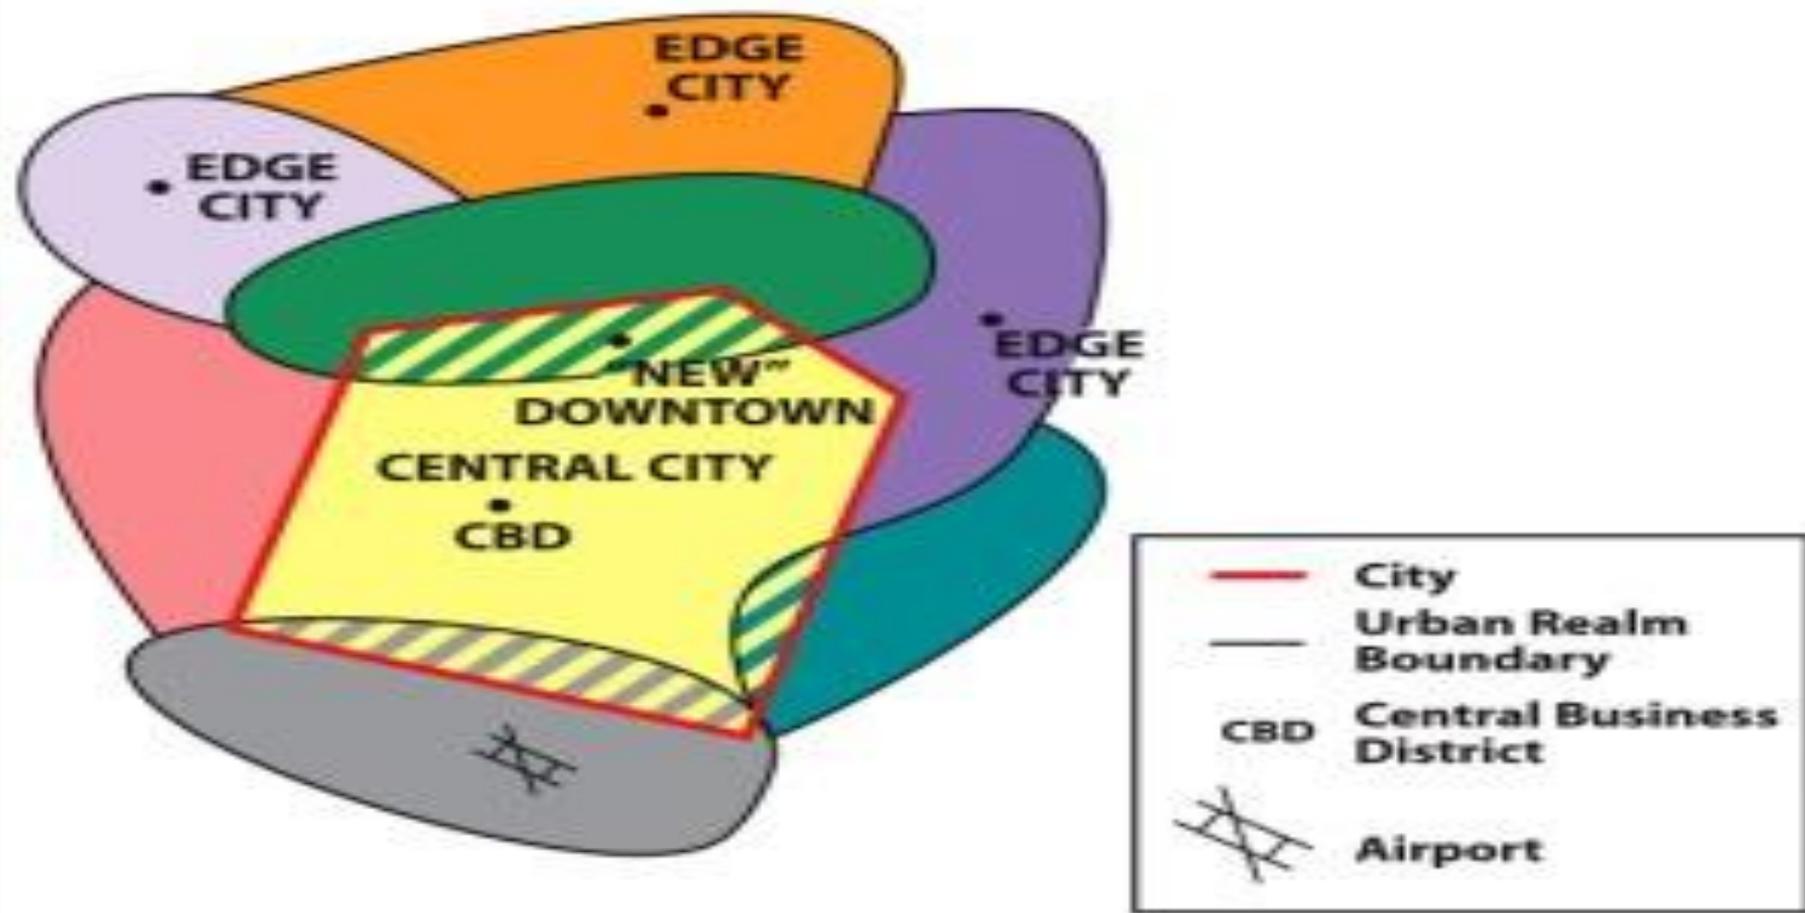

ports

universities

CBD is still the commercial hub of the city

Most cities follow this model, growth occurs where needed (edge cities, multiplier effect)

# URBAN REALMS MODEL

# Urban Realms Model (1964)

James E Vance

Improved on the multiple nuclei model, based on San Francisco

Suggest they cities are made up of small “realms” which are self-sufficient urban areas with independent focal points

Explain suburban growth in terms of functions normally found in the CBD can be moved to the suburbs, diminishes the importance of the CBD

shopping mall, schools, hospitals, etc

# European Cities

European cities are much older and zone their cities differently than American cities.

Europeans have a philosophy that what is old should be preserved

Many of the streets have dendritic pattern looking like roots on a tree.

Designed for foot traffic before the use of cars. Streets are narrow

Usually smaller than the US

Wealthy individuals tend to live in the central city and lower classes live on the outskirts.

# European Cities Continued

Skyscrapers tend to be on the outskirts of cities as well..

Greenbelts- rural areas that are set aside to prevent urban sprawl.

Commonly used in the United Kingdom. Drive up the price of land in the cities.

Also prevent in-filling

# Eastern European Cities

Heavily influenced by communism during the Cold War.

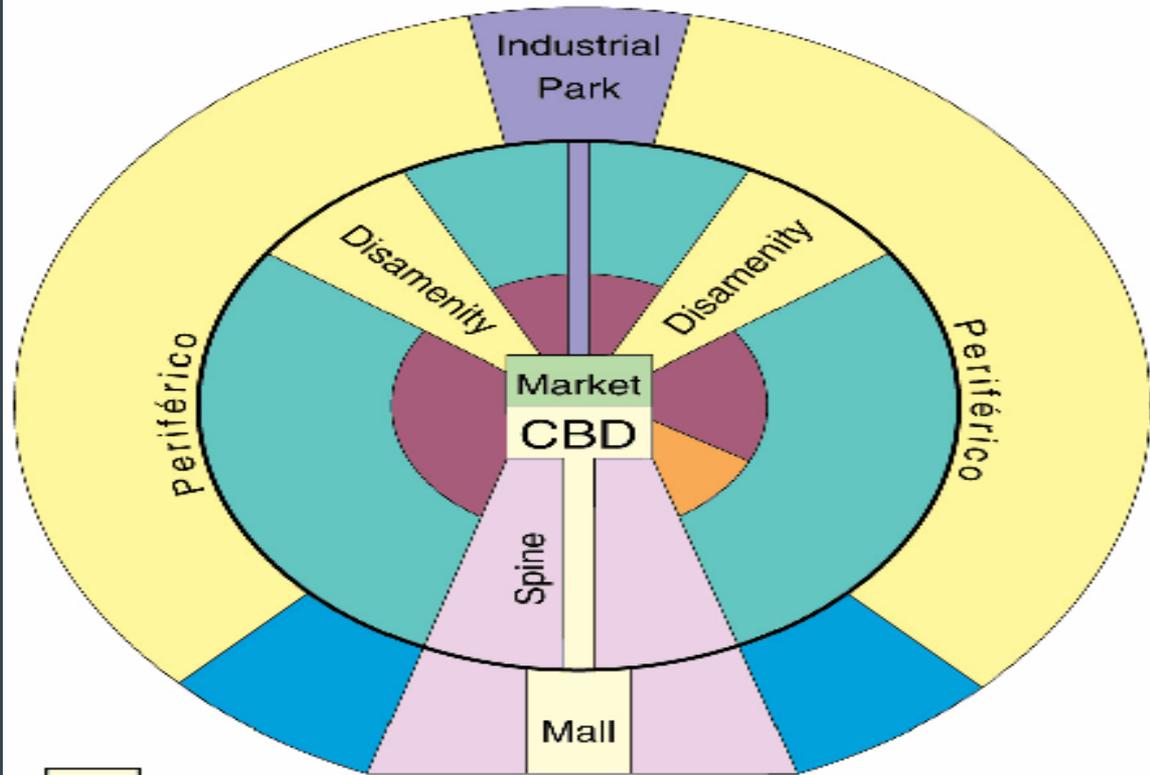

Design to be useful and efficient. Not to be attractive or interesting.

Since the fall of the USSR E European cities are emerging from the shadows of communist design.

# Latin American Cities

Often integrate their native pasts into their design.

Some of the highest urban growth rates. Due to the poverty of the countryside.

- |  |                          |  |   |
|--|--------------------------|--|---|
|   | Commercial               |   | Zone of <i>in situ</i> accretion        |
|   | Market                   |   | Zone of peripheral squatter settlements |
|   | Industrial               |   | Gentrification                          |
|   | Elite residential sector |  | Middle-class residential                |
|  | Zone of maturity         |  |   |

# Latin American Cities

Urban structure includes a “spine” of high-income residential areas. Spine extends from the central business district.

Gated Communities are come in this “spine.” Mostly for protection.

Squatter Settlements- areas of extreme poverty, are found on the outskirts of the cities.

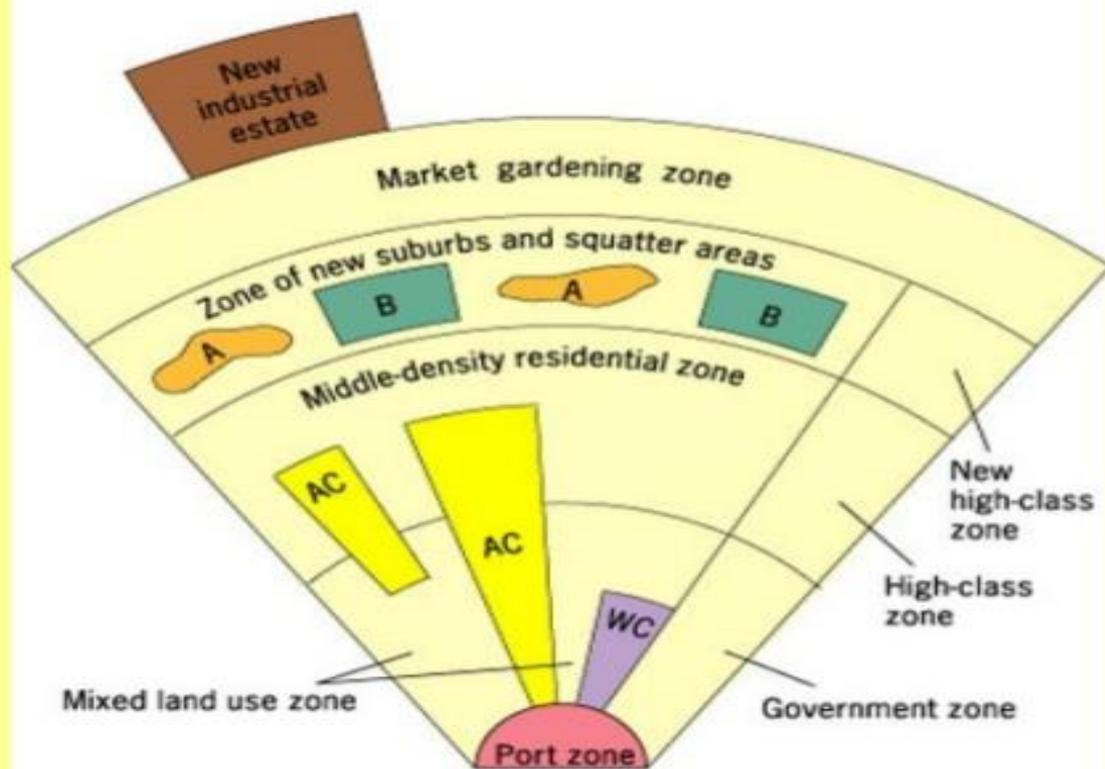

Favelas- another term to refer to the squatter settlements

Extreme poverty, number of people, and lack of government resources make control difficult.

Focus is on the CBD.

# SOUTHEAST ASIAN CITY (McGee Model)

## A GENERALIZED MODEL OF LAND USE AREAS IN THE LARGE SOUTHEAST ASIAN CITY

- |   |                |   |                         |
|---|----------------|---|-------------------------|
|   | Squatter areas |   | Alien commercial zone   |
|  | Suburbs        |  | Western commercial zone |

# Asian Cities

Mostly located on the coast and have been built for trade. Where most of their wealth is generated from (Asian Dragons).

Investments from more developed countries have helped this growth. (SEZs)

Model focuses on the importance of the port zone. (Entrepots, Singapore)

Western commercial zones are located near the port to export goods/products.

Malls are very popular as citizen earn more income.

Newer and tend to be more modern.

# Asian Cities

No formal CBD. Growth occurs throughout the city with few zoning laws.

Include a market gardening zone because of a preference for fresh produce.

# Islamic Cities

Found in the Middle East, North Africa, and Indonesia

Climate is hot. Streets are twisted to provide more shade.

Personal privacy is valued. Cul-de-sacs are highly valued for privacy.

Windows are small.

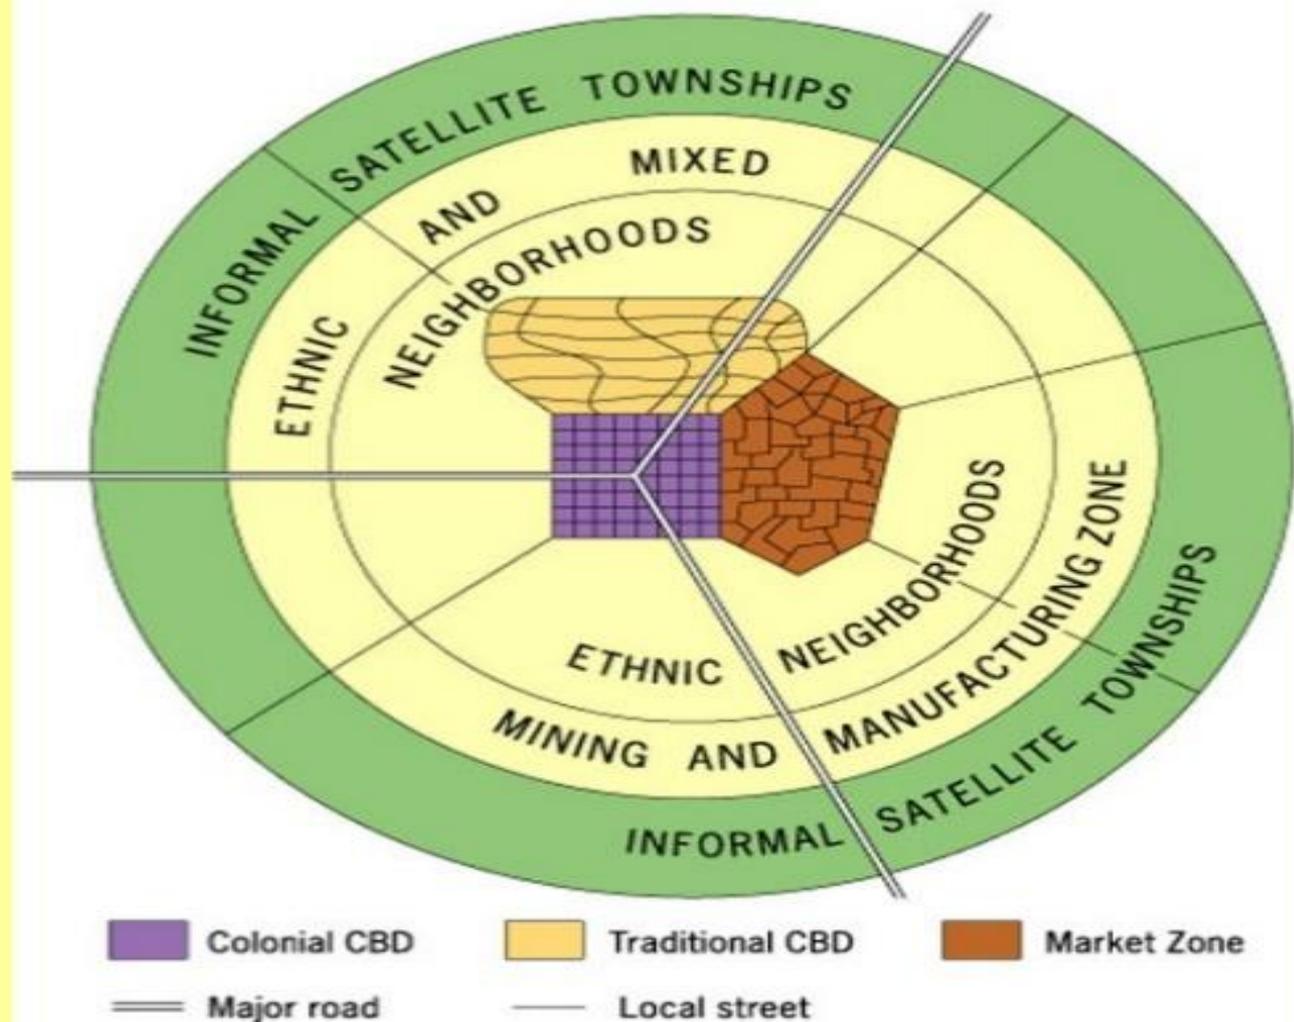

A central mosque is the focus of the city. City layout is based on the Koran.

Bazaars- street markets, especially in North Africa are common and can take up several city blocks.

Do have squatter settlements on the outskirts.

# THE AFRICAN CITY (De Blij Model)

A MODEL SUBSAHARAN AFRICAN CITY

# African Cities

Fastest growing urban centers in the world today. (SSA)

A strong colonial imprint is still evident as many were trade centers for exportation.

African cities have 3 CBDs.

Colonial CBD

Traditional CBD- current commercial center

Market (bazaar) similar to a farmers' market

Lack modern transportation systems. Many unpaved roads.

Exceptions are found in South Africa and Cairo.
